Nursing our future

An RCN study into the challenges facing today’s nursing students in Wales

Royal College of Nursing

November 2008
Summary of Key Findings
Today’s nursing students face many challenges – which may be financial, personal or relate to their studies. This survey, by the Royal College of Nursing, aims to uncover the realities of being a nursing student in Wales by reporting students’ own experiences. Over 4500 nursing students across the UK responded to an online survey between August and October 2008 including 190 nursing students in Wales.

- Nursing students in Wales are from across all age groups reflecting that many people now change jobs during their 30s and 40s. Half of nursing students (52%: UK 47%) responding to the survey were over 30, including 23% who were between 35 and 40 (UK, 17%), and 19% who were over 40 years (UK 19%).

- Rather than entering nursing straight from school or college, a majority of seven in ten (69%) were in paid employment before starting their nursing course. While this includes 35% who were in paid NHS employment (UK 21%), 35% were in other paid employment before starting their nursing course (UK 40%), demonstrating the number of students in Wales who have started nursing after another career, including previously working in the NHS has a health care support worker.

- Four in ten (42%) of nursing students in Wales responding to the survey had considered leaving their nursing course (UK 44%).

- Higher education institutions can direct support to students at risk of leaving – but only if they are aware who is considering leaving. Two thirds of those who had considered leaving (66%) reported that their personal tutor at university was not aware that they were considering leaving their course (UK, 74%).

- By far the most common reason for considering leaving was for financial reasons (63%, UK 62%) with students reporting financial debts from less than £1500 to more than £10,000.

- Three in ten (30%, UK 39%) of those who had considered leaving reported that their experience on a clinical placement had been a factor. This highlights the importance of quality clinical placements, with effective communication, support
and mentorship. Many students commented on travel with 17% (UK 15%) reporting that too much travel had contributed to them considering leaving their course.

- Other reasons that had contributed to students considering leaving their course included doubts over nursing as a career (22%, UK 24%), childcare difficulties (20%, UK 19%), personal problems (19%, UK 26%), and insufficient support from a university tutor (13%, UK 21%).

- Of those who had considered leaving, 91% reported that the reason they stayed was that they wanted to finish their course – demonstrating their commitment to continue their nursing career despite financial and other problems (UK 85%).

- Support from family and friends were important, with 61% reporting that this helped them decide to stay in nursing (UK 63%). Other reasons included support from a university tutor (24%, UK 15%), starting paid work to help financially (19%, UK 25%), and making other childcare arrangements (3%, UK 4%).

- 88% of nursing students in Wales reported they would be in paid work this autumn (UK 89%), 71% reported they continue to work whilst on clinical placement (UK 73%), and 68% have been in paid work throughout their nursing studies (UK 71%).

- More than three quarters (79%) of students who will be working this term will be working as a health care support worker (UK, 83%). Nursing students in Wales are marginally more likely to be undertaking bar work or jobs in retail than compared with all students across the UK.

- Nursing students in Wales reported working up to 30 or more hours a week in their paid job, with a third working up to 10 hours (38%, UK 37%), 41% working between 11 and 19 hours (UK 42%) and 13% working between 20 and 24 hours a week (UK 15%). The hours per week that students are spending either in formal study and paid work is high.

- Two thirds (67%, UK 73%) of nursing students in Wales reported that the money they earn helps them to stay on their course.
Paid work is impacting on nursing students’ studies. Two thirds (64%, UK 63%) report that they have less time to study; with four in ten reporting that working has a detrimental effect on their studies (41%, UK 30%). Half report that the impact of paid work is that they have to be more focused in the time they have available to study (51%, UK 50%).

83% of nursing students responding to the survey finance their studies through a non means-tested bursary (UK 64%), and 10% reported having a means-tested bursary (UK 25%). Other ways nursing students finance their courses apart from additional paid work include three in ten receiving financial support from their partner or family (29%, UK 27%), other allowances, and by taking on debt including overdraft, credit cards, and loans.

Seven in ten reported having an overdraft (69%, UK 62%), and over half reported credit card debt (53%, UK 51%). Many students reported having loans, including a student loan (18%, UK 33%), loans from family (41%, UK 38%), bank loans, (27%, UK 29%) and from friends (3%, UK 9%).

Three quarters of nursing students in Wales responding to the survey reported that they thought they would finish their nursing studies with debt (excluding any mortgages) (78%, UK 75%).

Students proposed a range of factors that they would find supportive including support from universities, childcare and financial support. Students also valued support from the RCN.

89% of students in Wales reported that an online tutor service would be helpful (UK 86%), while 80% said that additional tuition would be valuable (UK, 82%). 66% reported that they would find a helpline at university useful for example to enable telephone contact while on clinical placement (UK 72%). Peer support was also valued; with 68% reporting a buddy service would provide useful support (UK 64%).

Counselling services were seen as useful by two thirds of nursing students in Wales responding to the survey (64%, UK 67%). Nearly half (45%, UK 50%)
reported that child care places/facilities would be of support, and 85% reported that they would find financial services helpful (UK 88%).

- The RCN offers nursing students a variety of direct support and information, plus access to peer support via the network of Student Information Officers. The majority of students reported they would find RCN support helpful including RCN library and information services (94%, UK 94%), the RCN Learning Zone (95%, UK 92%), the RCN website (95%, UK 93%), and support from a Student Information Officer (83%, UK 83%).

- Nursing students in Wales have high levels of motivation to complete their courses and become registered nurses, including among those who have considered leaving.

- When asked about their views on finding a post when qualifying, four in ten (43%) were confident of finding a full-time permanent post on qualifying (UK 52%), including 9% who were very confident (UK, 14%). One third were not sure of their chances of securing a full-time permanent post (35%, UK 33%), while 23% were not confident or not at all confident (UK 15%). Students across the UK are more likely to be confident than students in Wales of finding a full-time permanent post on qualifying (43%, UK 52%)
1. Introduction
Today’s nursing students face many challenges – which may be financial, personal or relate to their studies. This survey, by the Royal College of Nursing, reporting students’ own experiences aims to uncover the realities of being a nursing student in Wales.

2. Context
The last few years have seen fluctuating numbers of places for pre-registration nursing students in Wales. Two years ago the Welsh Assembly Government took the decision to cut the number of training places for nurses and other health professionals, with Wales training over 220 fewer nurses in 2007/8\(^1\).

However in 2008 the number of places was increased from 1,079 to 1,093, with an extra 180 return to practice courses over the next three years\(^2\). This year also saw an increase in the number of community nursing course places.

Within this context of variable intake numbers, it is timely to examine nursing students’ current experiences in Wales.

3. Method
An online survey was prepared and then publicised from August 2008 on the RCN student pages of the RCN website, by email and through networks, including the peer network of RCN Student Information Officers. By the closing date in October, over 4500 nursing students across the UK had responded including 190 in Wales (Figure 3.1).

4. Profile of Nursing Students
This section describes the demographic profile of nursing students in Wales who responded to the survey. This includes the gender and age profile and their background prior to starting their nursing course.

4.1 Gender
Nine in ten (87%: UK 89%) nursing students were female and 13% were male (UK 11%). This is broadly comparable with the gender split on the Nursing and Midwifery Council register\(^3\) with shows that 89% of nurses are female and 11% are male.

4.2 Age Profile
Nursing students are now from across all age groups reflecting that many people now change jobs during their 30s and 40s (Figure 4.1). A third of nursing students in Wales (32%) were aged between 18 and 24 years, with 16% aged between 25 and 30 years. Over half of nursing students (52%: UK 47%) responding to the survey were over 30 including 23% who were between 35 and 40 (UK, 17%), and 19% who were over 40 years (UK 19%).

The age profile in Wales is different from that across the UK, as more students are aged between 35 and 45 (39%, UK 28%), with fewer aged between 18 and 24 years (32%, UK 35%).

The age span of nursing students demonstrates the wide range of people being attracted to a nursing career, and the diversity of life and work experience that are now brought to nursing. The average age of a nurse in Wales is now 42, the same as for the UK as a whole, with the age profile growing steadily older over the last 20 years\(^4\).

\(^3\) Nursing and Midwifery Council (2007) Statistical analysis of the register 1 April 2006 to 31 March 2007
The age profile serves to highlight the range of flexible support that students with different life experiences, family and financial commitments may require to enable them to stay in nursing. This also indicates that many nursing students will experience a shorter working life as a nurse than in previous generations. This has implications both for workforce planning and for nurses’ careers.

4.3 Nursing degree courses
Over one quarter (27%) of nursing students in Wales were in their first year (UK 20%), 37% were in second year (UK, 36%), and 25% were in third year (32%). 11% of nursing students reported they would complete their course by the term starting in autumn 2008 (UK, 11%).

The majority were studying adult nursing (72%, UK 73%), with 15% studying mental health (14%), 10% studying children’s nursing (11%), and 3% studying learning disabilities nursing (UK 2%).

4.4 Before nursing
Rather than entering nursing straight from school or college, a majority of seven in ten (69%) were in paid employment before starting their nursing course. This includes 29% who were in paid NHS employment – as a health care assistant/auxiliary or support worker, and 5% who were in other paid NHS employment. More students across Wales (30%, UK 21%) had been in paid NHS employment (health care support
worker or other), than across the UK as a whole (Figure 4.2). Over one third (35%) were in other paid employment before starting their nursing course demonstrating the number of students in Wales who have started nursing after another career.

One fifth (20%) were at college prior to starting their nursing course. 11% were at school. Other nursing students were undertaking full time child care or other caring responsibilities or were receiving benefits before starting their course.

**5. Intentions to leave their nursing course**

**5.1 Have you ever considered leaving?**

The survey sought to address how many students may have considered not completing their studies. Four in ten (42%) of nursing students in Wales responding to the survey had considered leaving their nursing course. This is comparative to peers across the UK, 44% of whom had considered leaving their course.

When a student is considering leaving, they could be regarded as ‘at risk’. Higher education institutions can direct support to at risk students – but only if they are aware of who is considering leaving.

Two thirds of those who had considered leaving their course (66%, UK 74%) reported that their personal tutor at university was not aware that they were considering leaving.

Some universities across the UK are working with systems to identify and then target support at those students most at risk of leaving their course. If many students do not
inform their tutor that they may leave, it will not be apparent to teaching staff that many students may be at risk of leaving. This is of particular concern given the range of reasons given by students as to why they had considered leaving – many of which are not related to their experience of study or academic performance.

5.2 Why might students leave their course?
Respondents to the survey, who reported that they had considered leaving their course, were asked the reasons that had contributed to this view (Figure 5.1).

By far the most common was for financial reasons (63%, UK 62%). This links closely with students’ experience of paid work during their studies which is reported in section 6.

With so many nursing students undertaking paid work during their course, it is not surprising that financial reasons are so prominent. With many nursing students in debt, the question of a liveable bursary is raised. A higher bursary could reduce the numbers who would consider leaving for financial reasons and reduce the numbers in additional paid work.

Figure 5.1 Reasons why nursing students consider leaving their course
Those who had considered leaving for financial reasons reported financial debts from £1500 to more than £10,000. 47% of nursing students in Wales responding to the survey reported that debt of between £1500 and £2999 had prompted them to consider leaving, and 43% reported that when considering leaving for financial reasons, their level of debt was more than £3000.

Clinical placements had a key role. Three in ten (30%) of those who had considered leaving reported that their experience on a clinical placement had been a factor. This highlights the importance of quality clinical placements, with support and mentorship. The role of effective communication between student, tutor and those at the clinical placement is vital.

Many students commented on the travel associated with clinical placements. 17% reported that too much travel had contributed to them considering leaving their nursing course.

Support from a personal tutor is vital. 13% of those who had considered leaving reported that insufficient support from a university tutor had been a reason for this view.

Students’ personal circumstances also play a part in their career decisions. One fifth (19%) reported that personal problems had been a reason for them considering leaving their course. One fifth (20%) of those who thought about leaving reported that childcare difficulties had been a main reason.

Doubts over nursing as a career were reported by a minority of nursing students. One fifth (22%) reported that doubts over whether nursing was the right career for them had contributed to them considering leaving their course. 4% reported that they had not been sure that the branch they had chosen was right for them.

Figure 5.2 provides a comparison between Wales and across the UK of reasons that had contributed to students considering leaving their course.

5.2 So why did they stay

Although many nursing students may have at one time considered leaving their course, there is a strong commitment to complete their studies coupled with a range of support that has enabled them to stay in nursing.

Of those who had considered leaving, 91% reported that the reason they stayed was that they wanted to finish their course – demonstrating their commitment to continuing their nursing career despite financial and other problems.

This may reflect the fact that many of those who had made the active life decision to leave a previous job to go into nurse training are highly motivated to become a registered nurse.

Support from family and friends was important, with 61% reporting that this helped them decide to stay in nursing. 3% reported that making other childcare arrangements helped them decide to stay on their course.

For one fifth (19%) of those who had considered leaving, starting paid work which had helped financially had contributed to enabling them to stay in nursing.

One quarter (24%) reported that support from their tutor at university had helped them decide to stay on their course, and a small number had changed branch and stayed in nursing. This demonstrates that support from higher education institutions via tutors can result in students staying on their course.
For many students it was a combination of reasons that helped them decide to stay on their course (Figure 5.2).

6. Working while studying

6.1 Extent of additional paid work

This survey has provided the opportunity to find out from nursing students the extent of additional paid work they are undertaking.

88% of nursing students in Wales reported that they would be in paid work during the term starting this autumn 2008 (UK, 89%). While some students will be working during term breaks, the majority are working throughout their student life. 71% of nursing students in Wales reported that they work whilst on clinical placement (UK, 73%). Two thirds (68%) of nursing students in Wales responding to the survey reported that they had been in paid work throughout their nursing studies (UK, 71%). (Figure 6.1).

**Figure 6.1 Experiences of paid work whilst a nursing student, Wales and UK**
6.2 When did they start work?
Nursing students start undertaking paid work at different stages of student life. Of those students who had not been in paid work as they started their nursing studies, more than half (57%) of those in Wales had started paid work during their first year of study (UK, 48%), with 40% starting paid work in second year (UK: 43%), and 3% in third year (UK: 8%) (Figure 6.2). This implies that although many students started their studies without also undertaking paid work, many quickly began paid employment to supplement their income.

Figure 6.2 When students started paid work

6.3 What type of job?
Of those students in Wales who will be in paid work during term time in autumn 2008, more than three quarters (79%) will be working as a health care support worker – one third on a nurse bank (36%), one quarter in the NHS (23%), 11% for a nursing agency and 9% in a care home. Nursing students in Wales are marginally more likely to be undertaking bar work or jobs in retail than compared with all students across the UK. Students across the UK are more likely to be working as a health care support worker (83%) than in Wales (79%) (Figure 6.3).
6.4 How many hours?

Nursing students in Wales reported working up to 30 or more hours a week in their paid job, with a third (38%) working up to 10 hours (UK 37%), 41% working between 11 and 19 hours (UK 42%) and a 13% working between 20 and 24 hours a week (UK 15%).

A third (34%) are spending 20 to 24 hours a week on lectures/tutorials/formal study at university (UK 27%), 29% are spending 25 to 29 hours a week (UK 20%), and 29% are spending 30 or more hours per week (UK 18%). With the high numbers also undertaking paid work, the hours per week that students are spending either in formal study and paid work is high.

Figure 6.4 shows how many hours a week on average nursing students in Wales are spending in lectures/tutorials/formal study at university, and how many hours a week on average they are spending in paid work.

Nursing students are undertaking paid work to supplement their income. Two thirds of nursing students in Wales responding to the survey reported that the money they earn helps them to stay on their course (67%, UK 73%).
6.5 Impact of paid work on studies

However, paid work is impacting on nursing students’ studies. Two thirds (64%) report that they have less time to study; with four in ten (41%) reporting that working as a detrimental effect on their studies. Half (51%) report that the impact of paid work is that they have to be more focused in the time they have available to study. Only 10% reported that the paid work they undertake has no impact on their study. Figure 6.5 compares the views of students in Wales with views of students across the UK.

7. Student Finance

7.1 How students finance their course

83% of nursing students in Wales finance their studies through a non means-tested bursary, and 10% reported having a means-tested bursary (Figure 7.1).

Other ways in which nursing students finance their courses, apart from additional paid work, include three in ten (29%) receiving financial support from their partner or family, other allowances, and by taking on debt.

7.2 Levels of debt

Nursing students in Wales reported varying levels of debt, with many having a variety of debts including overdraft, credit cards, and loans (Figure 7.2).

Figure 7.2 Types of debt (excluding mortgage)

Seven in ten (69%) reported having an overdraft (UK 62%), including 17% with an overdraft of under £499, 18% with an overdraft of between £500 and £999, and 30% with an overdraft of between £1000 and £2999 (Figure 7.3).

Over half reported credit card debt (53%, UK 51%), including 7% with debt of under £499, 18% with debt between £500 and £999, and 16% with credit card debt between £1000 and £2999.
Many students reported having loans, including a student loan (18%, UK 33%), ranging from under £499 to more than £10,000. Other loans included loans from family (41%, UK 38%), the bank, (27%, UK 29%) and from friends (3%, UK 9%).

Three quarters of nursing students in Wales responding to the survey reported that they thought they would finish their nursing studies with debt (excluding any mortgages) (78%, UK 75%). Figure 7.4 shows the type of debt students expect to have at the end of their studies compared with their current debts.
8. What support could be given to nursing students?
All students responding to the survey were asked what support could be given to nursing students. A range of factors were reported including support from universities, childcare and financial support. Students also valued support from the RCN.

8.1 Support from universities
The role universities can play in supporting students seems to be key (Figure 8.1). Nursing students in Wales and across the UK held similar views as to the support they would find helpful. 89% of students in Wales reported that an online tutor service would be helpful (UK 86%), while 80% said that additional tuition would be valuable (UK, 82%).

66% reported that they would find a helpline at university useful for example to enable telephone contact while on clinical placement (UK 72%). Peer support was also valued; with 68% reporting a buddy service would provide useful support (UK 64%).

Figure 8.1 University support nursing students would find helpful, Wales

Counselling services were seen as useful by two thirds of nursing students in Wales responding to the survey (64%, UK 67%), which links to the numbers of students
experiencing personal and other problems while studying and also the numbers who have considered leaving.

8.2 Childcare
Given the age range of nursing students, many have caring responsibilities for children, and also for other dependent adults. Nearly half (45%) reported that childcare places/facilities would help (UK 50%).

8.3 Financial support
The majority of nursing students are living with the reality of debt and additional paid work during their studies. This corresponds with the majority of 85% who reported that they would find financial services helpful (UK 88%).

8.4 Support from RCN
The RCN offers nursing students a variety of direct support and information, plus access to peer support via the network of Student Information Officers (Figure 8.2).

94% reported that RCN library and information services are helpful support for nursing students (UK 94%), 95% reported that the RCN Learning Zone would be a support (UK 92%), and 95% said that the RCN website was helpful to them as a nursing student (UK 93%).

Figure 8.2 RCN support nursing students would find helpful, Wales
Peer support was seen as valuable, with support from a Student Information Officer being reported by 83% (UK 83%). A Student Information Officer is a pre registration nursing student who shares information from the RCN with their colleagues and can signpost their peers to information, events and support.

9. Hope for the future

Nursing students in Wales have high levels of motivation to complete their courses and become registered nurses, including among those who have considered leaving.

When asked about their views on finding a post when qualifying, four in ten (43%) were confident of finding a full-time permanent post on qualifying, including 9% who were very confident. One third were not sure of their chances of securing a full-time permanent post (35%, UK 33%), while 23% were not confident or not at all confident (UK 15%).

Students across the UK are more likely to be confident than students in Wales of finding a full-time permanent post on qualifying (43%, UK 52%) (Figure 9.1).

10. Conclusions
As our future nursing workforce, investment in appropriate support for nursing students makes practical and financial sense. Better supported students would mean reduced student attrition with more students contributing to the nursing workforce as registered nurses.

With many now coming to nursing as a second career, at an older age, and with different career pathways into nursing, recognition must be given to the variety of flexible support that can meet the needs of this diverse student population.

Higher education institutions, the Welsh Assembly Government and other stakeholders including the RCN have a role in looking at how to improve recruitment, retention and support that can be offered to nursing students in Wales.

This survey has demonstrated that students would value a range of academic support, including additional tuition, online support and help lines with the facility for telephone support while on clinical placement. Other practical, but vital support, is to make available childcare places/facilities and support to enable parents to continue on their courses. Students also value the range of support that the RCN can offer.

Given the number of nursing students in paid work throughout their studies and while on clinical placement, financial support is of great importance. The range and level of debt and incidence of paid work highlights that the current bursary does not provide a liveable financial package. Raising the bursary would enable many students to be able to study without taking on additional paid work and debt, and also leave them more time to study.

Being able to identify those at risk of leaving, ensuring students are encouraged to inform their tutors of any difficulties and then enabling appropriate support and interventions does have the potential to encourage many more students to stay on their course and therefore enter the nursing workforce and care for patients.
11. Recommendations

This report has reviewed nursing students’ experiences and has provided insights into demographics including age profiles. The report shows that a substantial number have considering leaving and identifies the reasons for this as well as factors that would encourage them to stay. It also looks at their experiences of paid work and financial debt, and their hopes for their future nursing career.

The following recommendations will help more students to stay on their course and enhance their learning experience:

- recognise the changing demographics and ensure that appropriate flexible support is available to suit the diverse student population.

- examine the reasons why students consider leaving and ensure higher education institutions can implement and sustain policies to identify at risk students, including looking at ways to maximise tutors awareness of those considering leaving.

- ensure the range of possible interventions from higher education institutions to support students includes those they value for example, additional tuition, online support, help lines and buddy services.

- focus on ensuring quality clinical placements including concentrating on mentorship, communication and location of placements to reduce where possible unnecessary travel.

- provide resourced services to ensure nursing students can access counselling should they need this service.

- ensure childcare places/facilities and options are available to parents.

- address students’ financial debt and levels of paid work by increasing the student bursary.
